Class Timing: Friday 6–9 PM

AI-Driven Development – 30-Day Challenge

Task 7

SPECK it Plus is an open-source toolkit built to bring discipline and structure to modern software development. It follows the principles of **Spec-Driven Development (SDD)**, where specifications become executable drivers of the entire workflow. Instead of static documents, specs actively shape planning, architecture, and implementation. The result is a clear, consistent, and traceable development lifecycle from idea to delivery.

1. /constitution

Defines the foundational rules of the project. This includes coding conventions, architecture principles, quality criteria, and overall development philosophy. It acts as the governing charter for every decision that follows.

2. /specify

Captures the project's goals, user needs, and expected outcomes. It clarifies **what** must be built and **why it matters**, without touching the technical solution.

3. /plan

Converts the specifications into a detailed execution blueprint. This involves selecting tools, mapping architecture, designing workflows, and outlining how the solution will be built step-by-step.

4. /tasks

Breaks the plan into precise, trackable units of work. Every task represents a clear, measurable action that contributes directly to the planned architecture and requirements.

5. /implement

Transforms tasks into working software. This phase handles coding, testing, integration, and refinement, all executed according to the established standards and roadmap.
